

## Limitations list of Qaleido Communications:

### QVideo

- Qvideo does not work with Chrome embedded flash. You will have to disable it and to install instead the adobe flash plug-in (<http://get.adobe.com/flashplayer/>)

### QSync apps

- You cannot share files from the QSync Clients. Files shared to you are visible, but new shares can be made only from the Qaleido application.
- The QSync Mac Client works only on OS x 10.6
- The QSync Client for iPhone/iPad works on IOS 4.3+
- The QSync Client for Android works on versions 4.0.3+

### Qsync Windows app

- We suggest to set the polling time to a value bigger than 10 seconds (which is the default setting), especially if you have several files/folders that are synchronised

### CalDAV, Events

- on MAC Calendar the client requests full calendar load (all time), we limit this request to only one year before events.
- on iPad/iPhone client only requests events from one week earlier in the past

### CalDAV, Tasks

- Caldav-Sync for Android doesn't support the tasks sync yet. The "Tasks" (free) application should be also installed in order to synchronize tasks.
- the „Tasks“ application used for synchronising tasks does not support reminders yet

### CalDAV/CardDAV

- Carddav / Calcalc implementation has been approved on iPhone3/4/5, iPad2,3, IOS6,7, Android 4.2.x, MAC OS 10.8.x
